

Experience review:

Aspects I Wish I had done differently:

Looking back, I wish I had spent more time with my doctor earlier in my process. Although I eventually got the number I wanted, some delays and misunderstandings could have been avoided with clearer communication. I also wish I had spent more time integrating comments into my code, because it was harder than I expected.

Experience with providers:

Overall, my experience with my doctor was good. They responded to my requests for code and clarification and worked hard to resolve any issues I had with their code. However, there were situations where I thought communication could have been better, especially in terms of providing updates and responding to my questions in a timely manner.

Lesson learned:

This exercise taught me the importance of clear and effective communication in collaboration. It also highlights the need for good testing and usability when integrating external code into a broader framework. Going forward, I will devote more time to collaboration and communication between similar projects and make collaboration more careful and thoughtful.

Overall impressions:

Despite some challenges, I found this exercise useful for learning to work with other coders and collaborate with others in a software development environment. I believe that the knowledge and experience gained from this exercise will be very useful in my future career as a software developer.
